TECHNICAL PROJECT SUMMARY

ExpenseAI

AI expense tracker: frontend, local storage, AI/OCR features, login flow, analytics, and macOS desktop app packaging.

Field	Details
Project type	Local-first React expense tracking app
Prepared on	May 18, 2026
Project folder	/Users/aswinsanthosh/Downloads/src 3
Desktop app	/Users/aswinsanthosh/Desktop/ExpenseAI.app
Primary build command	npm run build

One-line summary

ExpenseAI is currently a frontend-heavy, local-first app: the browser runs the React UI, local storage keeps app/user state, Tesseract.js reads receipt images, local rule-based AI suggests categories and insights, and a custom macOS app bundle launches the built site through a localhost server.

1. Executive Summary

- ExpenseAI is a smart expense tracker built as a React single-page application.
- The app supports login/sign-up, manual expense entry, optional notes, receipt scanning, AI category suggestions, analytics cards, spending charts, edit/delete controls, and dark/light theme.
- There is no separate cloud backend or production database in the current project. The app uses browser-side state and localStorage for the local demo experience.
- Receipt scanning uses Tesseract.js OCR in the browser and a custom parser that detects totals, merchants, and item-level bill details.
- The macOS desktop app is a custom .app bundle that starts a localhost server and opens the built site at http://127.0.0.1:8000/index.html.
